

Project name: ResQTh

Team name & members (id, name): (6931503013, Moe Pyae Pyae Aung) (6931503048, Nantararat Wonglakorn) (6931503003, Hlaing Htay Min)(6931503122, James Aloysius)(6931503123, Khag Ga)

The problem, in 2–3 sentences:

Foreign residents in Thailand face severe communication barriers, unfamiliarity with local infrastructure, and high stress during emergency situations. Existing emergency resources are scattered, language-restricted, or difficult to navigate quickly, leading to delayed action which could worsen their existing situation whether it is a minor or major case or miscommunication with first responders. ResQTh solves this by providing a unified, context-aware assistance directory with instant language translation and step-by-step guidance.

Who exactly has it (not “everyone”): foreign residents in Thailand who are unfamiliar with Thailand emergency services.

Why it matters / what it costs them today:

High urgency: In accidents or crimes, panic makes searching for regional hotlines or copy-pasting GPS coordinates dangerously slow. Wasting critical minutes on mobile web searches or navigating separate map apps leads to delayed emergency responder dispatch and an inability to show immediate context to local bystanders.

Low urgency: For post-incident issues (e.g., lost passport, non-violent theft), victims lack procedural guidance. Without step-by-step checklists or verified facility routing, they waste hours visiting the wrong police station or official office, risk missing legal reporting deadlines, and fail to log proper records for insurance or embassy claims.

GATE 1 — REACHABLE USERS (≥3, interviewed before Week 4)

1. Iyar/First year liberal arts international student — in person — 24th August 2026
2. Sam Rong/First year liberal arts international student — in person — 25th August, 2026
3. Ken/First year Software Engineering international student — in person — 26th August, 2026

GATE 2 — MVP SHAPE

3–5 planned functional requirements:

- FR-1 Detect user's location
- FR-2 Select an emergency category
- FR-3 Display the information
- FR-4 Natural-language quick add (AI)

Which FR carries a real rule or decision (not plain CRUD)?

FR-4 Instead of static database lookup, FR-4 processes freeform natural-language input through an AI parser to extract the category, province, and urgency level. It then applies a system rule that dynamically decides the UI pathway: routing high-urgency crises to immediate tools (one-tap dialing, GPS broadcast, Thai translation cards) or low-urgency situations to post-incident guidance (step-by-step checklists, facility routing) in FR-3.

What data has to persist between sessions?

Saved emergency contacts, user language preferences, bookmarked resolution checklists, and recent emergency query logs.

GATE 3 — ACCESS

Any data, licence or system you depend on — and how you know you can get it:

- OpenStreetMap / Mapbox API (for location & facility routing via public free tiers),
- Thailand Public Emergency Hotline directory (publicly available open data),
- LLM API (e.g., Gemini API free/developer tier for query classification).

PROCESS & TEAM

Chosen SDLC (with a 1-line reason):

Incremental SDLC: we can build a complete project in the shortest possible time meeting MVP; at the same time, we can grow it in a flexible and adaptable manner.
